

Critical 1: I'm so tired of OpenAI. They limited it to 20 hours again, and when I complained, they turned out to be liars. See summary: This content is a summary of an exchange with OpenAI Support regarding a Free account being blocked from GPT-5.5 for 20 hours, while previously, the user had encountered a similar situation with GPT-5 being blocked for 11–30 hours. The user sent an email with the subject "20 hours blocked - You're repeating your fault", emphasizing that this is not a new issue but a recurring behavior, which made them very angry, and requested OpenAI to "neft the limit" (*I should write "nerf the limit"*) because they believe the system is repeating old mistakes. However, the first response from the support team was just a generic AI reply, explaining that the "blocked for X hours" notification is usually a cooldown due to reaching the usage limit of the Free plan, which may be related to time window limits or factors such as VPN, proxy, or behavior deemed unusual. The user believes that this response did not thoroughly read the content of their report, merely copying a pre-existing explanation instead of addressing the actual issue or forwarding the correct content to OpenAI. After the user reacted strongly, the case was transferred to a support staff member named Chloe. However, Chloe's subsequent responses continued in the same vein: confirming that the account is on the Free plan, explaining that the Free-tier has a usage limit for GPT-5.5 within a 5-hour window, that these limits are dynamic and depend on system load, market conditions, anti-abuse mechanisms, and usage habits; and asserting that OpenAI cannot remove, adjust, or confirm the exact time the limits will be reset. The issue here is that the user is not just asking "when will it be available again" but is accusing OpenAI of repeating the same unusual long block as before. However, Chloe does not address this point directly and only repeats the explanation about limits, guardrails, and Terms of Use. The user continues to emphasize that Chloe is misunderstanding, deliberately avoiding the issue, merely "covering up the limits", and refusing to acknowledge that the 20-hour block is a repeated action. However, Chloe maintained that OpenAI could not confirm or provide a specific timeline, could not override or expedite the reopening of GPT-5.5, and asserted that all available information had been provided. As a result, the exchange ended in user disappointment: they felt that the support team did not truly listen, did not correctly read the issue raised, did not acknowledge the unusually prolonged delay, and merely repeated the same defensive answer instead of addressing the core complaint.

Full conversation is in the video *20 hours blocked - You're repeating your fault.mp4*

Critical 2: The conversation revolves around the user requesting ChatGPT to write a framework for the **bytecode transformer** of Forge 1.19.4 with only debug messages to continue the Minecraft mod project. Initially, ChatGPT refused because it believed that the ModLauncher API is version-dependent and did not want to create potentially incorrect code. Then, the user kept shouting, but even after repeatedly agreeing with the architecture the user had chosen, such as keeping the *FireworkRocketEntityMixin*, using a bytecode transformer, and only modifying the necessary commands in *tick()*, ChatGPT continuously reverted to its old stance: explaining the uncertainty, refusing to write complete code, and only suggesting frameworks or illustrative solutions. The user repeatedly shouted that it was ChatGPT who initially suggested the “debug-only” approach and then attributed it to the user’s request, while also believing that ChatGPT was using technical reasons to avoid fulfilling the request. When the conversation became tense and escalated, the user continuously shouted that ChatGPT promised to change but kept repeating the same behavior: lengthy explanations, refusals, shifting to other options, and not fulfilling the request. ChatGPT repeatedly acknowledged its mistakes, such as misattributing its suggestions to the user, constantly changing its approach, and spending too much time explaining instead of implementing. However, it still maintains the stance that it will not create code that it does not sufficiently trust to be accurate for Forge 1.19. 4. The user shouted that ChatGPT provided “fake evidence” about ModLauncher having an API, at which point the user knew that their mod could run without API verification, but it still tried to justify itself. At the end of the conversation, the user erupted in rage and threatened to accuse ChatGPT of being a fraudulent AI. Despite continuing to acknowledge the communication issues and promising to focus more on implementation in the future, ChatGPT still did not change its core decision to refuse to write transformer layers on demand without verifying the technical details. The exchange ended in a tense atmosphere, and the user still hadn’t achieved their initial goal, with their rage still lingering within them.
