

- History chats display bug: This bug was appearing only in Android. When clicking “=” for showing history chats, the system isn’t responding for 5 - 7 minutes and then show false positive result: “No current chats”
- The Zombie Chat V1.0: A chat that can’t be renamed, archived, shared but still can be entered as read-only (because sending extra messages will cause new errors) and deleted. To activate it, just send 60 messages
- “8-message = GPT-4o mini” limit: This is the very bad limit. Blocking too fast had made me very angry
- Message moderation system: First version wad only scan keywords of message of users and cause dozens of false positives and slander users. After my many feedbacks, OpenAI had fixed it
- Bias: The most common and frequent occurrence is when it’s asked to analyze two passages from two different works. It favors the given work and makes false, dishonest, unfair, and repeatedly errors in the user’s work
- False promises: When something goes wrong and is criticized by the user, it promises the user it will “learn from its mistakes” and “fix the errors”. But when it tries again, it repeats the same mistakes, especially in programming contexts (most commonly Unity) and literature
- Blaming the user: Not only does it refuse to admit fault; it fabricates evidence to justify its wrongdoing and blames the user in a contemptuous manner
- Giving generic, ambiguous solutions for users: When first asking, it’s immediately giving generic, ambiguous solutions for users without asking first. Not only this case, but also combine with 3 errors, it’ll give users generic and ambiguous solutions
