

- The bias, false promises, blaming users, generic and ambiguous solutions errors are becoming worse and worse
- Spam thinking: When ChatGPT free/Plus/Pro users have not asked to think and not selected “Think for longer” yet, ChatGPT thinks on its own, even when the user has explicitly stated not to think. It has repeated its thinking and wasted messages up to 20 times! Higher than GPT-4o and GPT-4-Turbo which only waste 5 - 8 times
- Bug Blindness and Imposing edits when coding: ChatGPT tries to make unnecessary edits, takes the wrong code as the right edit, claims it is right, imposes edits without understanding the code’s errors
- “Regenerate response” and “Change models” had been deleted. When wanting to change another answer, there were only 5 general buttons and a response line on the buttons: “Ask to change response” line, “Try again” button, “Add details” button, “More concise” button, “Think longer” button, “Search the web” button. The removal of this model change feature has caused annoyance to users, even worse than the old “Regenerate response” and “Change models” features of GPT-4

Here’s how 5 generic buttons and line are working that making users feel angry:

- Try again (Fake Regenerate Response): Not like Regenerate Response of GPT-4, it’ll quote its previous reply and reply to me
- Add details: Even though working, but when I criticize GPT-5 about its fault, it’ll generate generic reply, not related to its fault
- More concise: The worst button. It’ll generate too short reply
- “Think for longer” and “Search the web”: Not bad, same as original buttons of GPT-4, but they were still generic buttons
- “Ask to change response” line: Not good. When I write any requirements on this line, especially coding and admitting its fault, GPT-5 will write only code + even it won’t admit its fault

New message limit: Initially, in GPT-4, the limit was only 8 - 12 messages (*GPT-4o → GPT-4.1-mini for free users*) to use the GPT-4o model (*Time to restore GPT-4.1-mini → GPT-4o is 3 - 6 hours*). But in GPT-5, the limit for using the GPT-5 model, for free users, has reached 30 messages before dropping to GPT-5 mini and 12 hours or 25 - 30 hours (*rarely*) to restore GPT-5 mini → GPT-5! Too strict!

The limit message has been buffed in GPT-5. Instead of GPT-4’s 50 - 60 messages (*I’m guessing the message limit*), GPT-5 decrease limit to 40 messages. Even it’s smaller than DeepSeek’s limit

These errors had been appeared since July 9, 2025 (*I don't know*):

- The Zombie Chat V2.0: A chat that **can never be entered, CAN'T be renamed, and even CAN'T be DELETED**
- It turns out, the problem isn't the 40-message limit, but the file. Just send a file, regardless of the number of messages, and the system automatically reports "Message limit reached"
- New way to create The Zombie chat: 20 - 25 GPT-5 messages on old chat (*GPT-4*) = The Zombie chat
- When I sent the last message to ChatGPT, it was normal at first or show *getNodeByIdOrMessageId - no node found by id: [chat_id]*. But when I sent or selected any button (Try again, Think, Edit, etc.), the system said "Conversation not found". This means that the chat has turned into a Zombie chat
- I try turning on/off sync, but The Zombie chat still appear
- Every time The Zombie chat appears, "Messages Limit reached" (40-message limit) comes back again, and existed only 40 minutes
- Thursday, August 28, even though there's no more The Zombie chats appear, OpenAI recovery 40-message limit. So many chats are being blocked by the system for chatting forever
- Thursday, August 28, OpenAI recovery 40-message limit, so many chats are being blocked by the system for chatting forever. But in Saturday, August 30, OpenAI removed 20-message limit again. This loop is incredibly confusing
- Let me explain what this loop is: About a week ago, I tried sending 20 messages to 3 old chats (GPT-4 chats), which resulted in *getNodeByIdOrMessageId* appearing at the end of the message count, and after sending the last message, all chats were zombified. Each zombie chat triggered the 40-message limit, which blocked many chats. OpenAI restored the 40-message limit on the 28th, but just 2 days later, OpenAI removed it again
- I found a solution. Thursday August 30th, I logged out and logged back in have "resurrected" the chats that had been turned into zombies. Now I can use the old chats. But unfortunately, no patch from OpenAI was implemented today. But in latest version, OpenAI had removed 40-message limit, and it won't return forever
- The small fix: Time to restore GPT-5 mini to GPT-5 is decrease to 9 hours, but 24 messages = GPT-5 mini (*different between 30 messages = GPT-5 mini*) (*for each send messages on every chats*)
- Missing Context: In GPT-4, it was forgetting fast. In last phase of it, the "Reference chat history" feature had been added, but it was still forgetting. GPT-5, GPT-5.1 and GPT-5.2 are worse than GPT-4; the "Reference chat history" feature had been turned on, but they were still forgetting context and what I said

- GPT-5.1 errors:
 - + Message limit trigger: 8 messages = GPT-5 mini. OpenAI had repeated their legacy error (8 messages = GPT-4o mini)
 - + The *getNodeByIdOrMessageId* error was still appearing, specially on Unity
 - + It was still bad at C#
- GPT-5.2 errors:
 - + Change 1: The *getNodeByIdOrMessageId* error was disappeared anymore. It means The Zombie Chat V2.0 was slept
 - + Change 2: The model is now better at C#; but these errors like bias, blaming, provide generic and ambiguous solutions, false promises are still getting worse and worse and more often
 - + OpenAI was repeating their error: Increasing waiting limit to 11 - 28 hours vs 12 - 30 hours waiting error on GPT-5. After my feedbacks, they've fixed it to 5 - 6 hours
- GPT-5.6 errors:
 - + The Zombie File: I uploaded a document to Library (where archives files). Then I send to ChatGPT. The result is the system throw message "All the files uploaded by the user have been fully loaded. Searching won't provide additional information.". In ChatGPT side, file content gives content "Skipped N messages". I click the sent file and I see content is visible, but the ChatGPT is not. Zombie File appears in Web, PC and Mobile. A chat that contains 12+ files also trigger The Zombie File. Files pre-5.6 weren't zombified
 - + The Zombie Chat V2.5: If you archive the story analysis of chats that have too many messages, they can't be unarchived, renamed, shared and deleted; enter to them will kick the user with the message "This chat is too long. Start a new one"
