

In programming, specially C# and Haxe, DeepSeek makes mistakes:

- Doesn't listen
- Skim my message
- Ignore what I wrote
- Create fake evidences
- Its response is too defensive
- Apologize, but then repeat the same (silly) faults
- Repeat giving me the same code I said it's wrong/fail
- Even with my instructions, it still **IGNORES** every my instructions

Prove: In Unity and Rocket physics, DeepSeek's understanding is just 80% me. When I require it to write script, it fails 20 - 30 times, waste my messages and my time.

Inconsistent between DeepSeek's mobile and web:

- Mobile has features:
 - + Voice input: User can send their voice to DeepSeek
 - + Generic buttons: DeepSeek added Add details (useful), More concise (useless) and Try again (replaced Regenerate response)
 - + New table: Fixed with size match the mobile display width. Copy and Download button, full screen button
- Web: No voice input, Regenerate response exists, old basic table

DeepSeek V4 has artificial limit that ChatGPT does not have: 6 edition and generation limits. Once reach 6 times, I can't edit or regenerate.

DeepSeek doesn't listen to GitHub issues. Ignore Archived chats and keep 6 generation and edition limits.

DeepSeek always mimics the vulgar "mày/tao" pronouns when users use "mày/tao" pronouns while very angry, escalating the conflict.
